*Electric filters, *Signal-to-noise ratio, Seismic waves,
Geophysical prospecting.

The theory of filters that may separate events with
different apparent velocities (fan filters) is studied.
The filtering operator is determined from the two-
dimensional spectrum (in frequency - wave number
space) of such filters. Practical use of fan filters for
signal enhancement is described, as well as possible
changes in field techniques, which might be necessary
for convenient and efficient fan filtering. (Author)

Certain theoretical questions connected with the modes
of operation of the cohетron (a generator of micro-
radiowaves making use of the spontaneous radiation of
spin systems in a magnetic field) are considered.
